## **Full Disclosure Report of the LDBC Social Network Benchmark**

---

An Implementation of the LDBC Social Network  
Benchmark's Interactive Workload over AtlasGraph

December 25, 2023

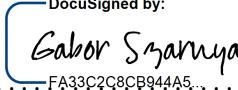

## GENERAL TERMS

### Executive Summary

The present document describes an audited run of the Interactive Workload of LDBC's Social Network Benchmark using AtlasGraph version 3.0.0. AtlasGraph is a graph database co-developed by StarGraph (Beijing Haizhi Stargraph Technology Co., Ltd.) and MadSys Group (Tsinghua University). The benchmark was executed while ensuring serializable isolation level. The audited runs assessing query performance were executed on three scale factors: SF30, SF100, and SF300. While AtlasGraph has the option to run declarative Cypher queries, the benchmark queries were implemented in the Rust imperative programming language. The graph schema used in the benchmark runs did not contain any precomputed attributes, and the used indices over attributes are explicitly marked in the data schema definition.

### Declaration of Audit Success

This report contains an audited LDBC benchmark execution. The results have been gathered by an independent and impartial auditor who has validated the implementation of the queries, successfully run the ACID tests associated with the claimed isolation level (serializable), and verified the overall system's configuration conformance to the description of the benchmark and its strict requirements.

## System Description and Pricing Summary

---

# 1 SYSTEM DESCRIPTION AND PRICING SUMMARY

## 1.1 Details of machines driving and running the workload

### 1.1.1 Machine overview

This benchmark used two r5d.12xlarge instances, one for the driver and one for the SUT. The instance details below were obtained from the Amazon Web Services console. The operating system name and version was obtained from running `cat /etc/os-release` command.

Table 1.1: Machine Type and Location

Cloud provider	Amazon Web Services
Machine region	China (Beijing)
Common name of the item	r5d.12xlarge
Operating system	Ubuntu 20.04.6

### 1.1.2 CPU details

The details below were obtained using the command `cat /proc/cpuinfo` (Listing A.1) and `lscpu` (Listing A.2) issued from the machine instance, and the datasheet of the used CPU type.

Table 1.2: CPU details summary

Type	Intel® Intel Xeon® Platinum 8259CL CPU @ 2.50GHz CPU
Total number	1
Cores per CPU	24
Threads per CPU	48
CPU clock frequency	2.5 GHz
Total cache size per CPU	L1d cache: 768KiB L1i cache: 768KiB L2 cache: 24MiB L3 cache: 35.8MiB

### 1.1.3 Memory details

The total size of the memory installed is 384GB, and this information was obtained using the `cat /proc/meminfo` command issued from the virtual machine instance. The details section of the `sudo lshw -c memory` returns `DIMM DDR4 Static column Pseudo-static Synchronous Window DRAM 3200 MHz (0.3 ns)`. For the latter command, see full output in Listing A.3.

### 1.1.4 Disk and storage details

The disk controller and motherboard type were not obtainable from the virtual machine instance. The storage consists of two individual 900GB NVMe SSD, formatted with the xfs filesystem. The storage size and type is from the Amazon Web Services website <https://aws.amazon.com/ec2/instance-types/r5/> (accessed: December 13, 2023). Actual disk parameters for the SUT instance were obtained by `sudo lshw -c storage -c disk` and are shown in Listing A.4.

The 4KB QD1 write performance was measured with the `fio` command and the output (Listing A.5) showed an average of 16 898 IOPS.

### 1.1.5 Network details

The presented benchmark ran in a client-server architecture. The network throughput performance was measured using the `iperf` tool. The key parts of the command output are presented in Listing A.6.

### 1.1.6 Machine pricing

The system pricing summary is included in the table below.

Table 1.3: Pricing summary

Item	Price
r5d.12xlarge reserved instance machine in AWS (standard 3-year term)	232 461 RMB
Software license	1 200 000 RMB
Maintenance fee (3 years)	600 000 RMB

### 1.1.7 System availability

The latest software version of AtlasGraph (version 3.0.0) was made available on November 28, 2023. This version was deployed to the machine described in this section.

## Dataset Generation

---

## 2 DATASET GENERATION

### 2.1 General information

The data generation settings of the LDBC Datagen are described below.

Table 2.1: Datagen settings summary

Datagen version	v1.0.0
Output format	CsvComposite serializer
Scale factors	10, 30, 100, 300

**Note:** Scale factor 10 is used for query results validation only, while the other ones were used for performance measurements.

### 2.2 Datagen configurations

The Datagen configuration for SF10 is shown in Listing 2.1. The configurations for SF30, SF100 and SF300 are shown in Listings A.7–A.9.

Listing 2.1: Contents of params-sf10.ini used for scale factor 10

```

1 ldbc.snb.datagen.generator.scaleFactor:snb.interactive.10
2
3 ldbc.snb.datagen.serializer.dynamicActivitySerializer:ldbc.snb.datagen.serializer.snb.csv.dynamicserializer.
   activity.CsvCompositeDynamicActivitySerializer
4 ldbc.snb.datagen.serializer.dynamicPersonSerializer:ldbc.snb.datagen.serializer.snb.csv.dynamicserializer.person.
   CsvCompositeDynamicPersonSerializer
5 ldbc.snb.datagen.serializer.staticSerializer:ldbc.snb.datagen.serializer.snb.csv.staticserializer.
   CsvCompositeStaticSerializer

```

### 2.3 Data loading and data schema

The output produced by the Datagen is converted to a custom (i.e., vendor-specific) CSV representation which can be loaded into the database (see the attached `prepare_snb.sh` script). The loading process takes a schema descriptor file `schema.json` (see Listing 2.2 and Listing A.10) which defines the data types represented in the graph, as well as a mapping configuration `mapping_sf{10,30,100,300}.json` (see Listing 2.3 and Listing A.11) that specifies which CSV columns are used to populate the respective edges and nodes in the graph.

Listing 2.2: Excerpt from `schema.json`, describing the data schema

```

45 }
46 }
```

Data loading times are shown for each scale factor in the table below. Values were measured using the GNU Time tool with the `-v` flag, reading the *Elapsed (wall clock) time* from the output. The column **CSV loading time** shows how long it took to create a graph from the input CSV files and also to build an index over properties marked `is_pk` (primary keys) and `is_index` in the schema. These times, however, do not include CSV conversion times (the CSV conversion was executed outside of the measurements and was not timed). The NA values in the **Data preprocessing time** column are indicating that there were no materialized views or other auxiliary data structures precomputed prior to executing the benchmark, and index creation times are included in the CSV loading times. The column **Total time** contains the sum of the CSV loading and data preprocessing times.

Table 2.2: Data loading times

Scale factor	CSV loading time (s)	Data preprocessing time (s)	Total time (s)
30	1 680	NA	1 680
100	6 791	NA	6 791
300	17 291	NA	17 291

## Test Driver Details

---

### 3 TEST DRIVER DETAILS

The driver and implementations version used are described below as well as the amount of read and write threads used by the driver.

Table 3.1: Summary of test artifacts and main configuration parameters

Driver version	v1.2.0	<a href="https://github.com/ldbc/ldbc_snb_interactive_driver/releases/tag/v1.2.0">https://github.com/ldbc/ldbc_snb_interactive_driver/releases/tag/v1.2.0</a>
Implementations version	v1.0.0	<a href="https://github.com/ldbc/ldbc_snb_interactive_implementations/releases/tag/v1.0.0">https://github.com/ldbc/ldbc_snb_interactive_implementations/releases/tag/v1.0.0</a>
LDBC SNB specification version	v0.3.6	<a href="https://arxiv.org/pdf/2001.02299v3.pdf">https://arxiv.org/pdf/2001.02299v3.pdf</a>
Driver read threads	64	
Driver write threads	64	

#### 3.1 Driver implementation

A test driver adaptation for the SUT was provided by the test sponsor. The archive created from the version of the driver used for the audited run is included in the attachments of this report.

The SUT-specific test driver class `io.atlasgraph.interactive.AtlasGraphInteractiveDb` extends the class `com.ldbc.driver.Db` provided in the LDBC SNB Interactive driver package. Internally, the `AtlasGraphInteractiveDb` relies on Google's packages `grpc` and `protobuf` for remote procedure calls (RPC) to communicate with the SUT.

#### 3.2 Benchmark configuration of driver

The driver applied the following time compression ratio values:

- TCR=0.001 for scale factor 30,
- TCR=0.0026 for scale factor 100,
- TCR=0.0092 for scale factor 300,

The complete configuration files for the different scale factors are shown in Listings A.12–A.14, and are also included in the attached supplementary materials.

## Performance Results

---

### 4 PERFORMANCE RESULTS

The performance results reported here show benchmark executions with scale factors 30, 100, and 300. The performance summary tables below highlight key performance characteristics. In each case, the query on-time compliance is higher than the minimum required 95%<sup>1</sup>. The performance summary tables below highlight key performance characteristics.

Table 4.1: Summary of results for scale factor 30

Benchmark duration	Benchmark operations	Throughput	Query on-time compliance
02h 00m 27.559s	271 982 072	37 631.25 $\frac{\text{operations}}{\text{second}}$	99.86%

Table 4.2: Summary of results for scale factor 100

Benchmark duration	Benchmark operations	Throughput	Query on-time compliance
02h 01m 35.871s	355 776 423	48 764.08 $\frac{\text{operations}}{\text{second}}$	96.22%

Table 4.3: Summary of results for scale factor 300

Benchmark duration	Benchmark operations	Throughput	Query on-time compliance
02h 04m 58.344s	362 257 201	48 311.63 $\frac{\text{operations}}{\text{second}}$	95.24%

A remark on the throughput on scale factor 30: the system under test achieved the highest possible throughput allowed by SNB Interactive. This is due to an inherent limitation of the benchmark framework. The benchmark specification prescribes a 2.5h minimum execution time (0.5h warmup, 2h measurement window), while there is also a finite amount of update operations available from the update stream. On SF30, the available update stream is exhausted before the benchmark's runtime could reach the prescribed minimum execution time, as having a higher throughput would result in an invalid benchmark run.

<sup>1</sup>The total number of late operations for each run in the results in the attachment is referred to as `excessive_delay_count`.

## Validation of the Results

---

### 5 VALIDATION OF THE RESULTS

The scale factor 10 data set was used for validating the correctness of the implementation over the SUT. The validation data set was downloaded from the LDBC repository<sup>1</sup> and it was originally created with the SNB Interactive reference implementation over Neo4j. The system with the driver configuration shown in Listing A.15 successfully returned the expected result sets for the queries of the benchmark.

---

<sup>1</sup>[https://pub-383410a98aef4cb686f0c7601eddd25f.r2.dev/interactive-v1/validation\\_params-interactive-v1.0.0-sf0.1-to-sf10.tar.zst](https://pub-383410a98aef4cb686f0c7601eddd25f.r2.dev/interactive-v1/validation_params-interactive-v1.0.0-sf0.1-to-sf10.tar.zst)

## ACID Compliance

---

### 6 ACID COMPLIANCE

#### 6.1 Transaction isolation level

The benchmark was executed using the *serializable* isolation level setting of the SUT, which is more strict than the *read committed* isolation level minimally required by the SNB Interactive specification, and therefore complies with the requirements of the benchmark.

#### 6.2 SNB ACID test results

The ACID test implementations were reviewed to conform to the ACID test specifications, with all specified test cases implemented. Furthermore, test execution was successful, no atomicity and isolation test failed with serializable isolation level transaction settings.

#### 6.3 Recovery and durability

##### 6.3.1 Recovery

Durability tests were using the regular benchmark workload with scale factor 30, and the server machine was shut down using the command `sudo shutdown -r` after executing 260 million operations.

##### 6.3.2 Durability

From the driver log, the last update operations before the crash were obtained using the commands below.

```

1 $ grep LdbcUpdate1 LDBC-SNB-results_log.csv | tail -n 1

```

From the logs, the last completed updates were retrieved for each update operation. The log entries include the operation name, actual and scheduled start time, the execution time, the delay between scheduled and actual start times, and the initial query start time without the TCR multiplier (this latter one is included in the last column). Using this information, the query parameters were obtained from the initial CSV files generated by the Datagen as shown below.

```

1 $ grep -rnw /disk1/SF30/social_network/ -e '1354402963802|.*|1|.*'

```

To check whether the graph entities in the driver log entries were persisted in the database, read queries targeting the last completed update operations were executed after database restart. The queries returned the data that was committed according to the logs, so the system passed this check. These queries and their output is shown below using the Cypher REPL of the system (output is slightly formatted for better presentation in this document).

### 6.3.3 Consistency after recovery

The benchmark relied on no precomputed auxiliary data structures, thus no additional steps were required to check consistency. After the crash, the database was successfully started using the usual startup procedure.

## Supplementary Materials

---

### 7 SUPPLEMENTARY MATERIALS

The table below shows the list of supplementary materials. These materials are made available with this full disclosure report to allow reproducibility of results.

Table 7.1: Supplementary materials

File	Purpose
README.md	Guide with exact steps for tool installation and benchmarking
results-sf{30,100,300}.tar.gz	Driver output files for the selected scale factors
acid-test	Rust project with ACID test suite implementation
atlasgraph-3.0.0.deb	AtlasGraph binary package
query-impl	Folder containing the implementations of benchmark queries
data-generation	Folder with datagen parameters for the used scale factors
data-loading	Graph schema and CSV data mapping
data-preprocessing	CSV converter scripts and utilities
deployment	Resources for deployment of AtlasGraph using Ansible
driver	LDBC SNB driver resources
driver/atlasgraph{/src}	AtlasGraph-specific LDBC SNB driver resources and sources
build.sh	LDBC SNB driver build script
run.sh	AtlasGraph-specific LDBC SNB driver run script
*.properties	Driver parameters for SF30, SF100, SF300, and validation (SF10)
