Preface

This is the Full Disclosure Report for the benchmark results produced by Semantic Publishing Benchmark v2.0 for GraphDB EE 10.1.0, Scale Factor 5 (1B Triples), using a single r6id.8xlarge AWS server.

General Terms

Test Sponsor

Test sponsor of this benchmark is Sirma AI Ad, trading as Ontotext, Bulgaria. Ontotext is a global leader in enterprise knowledge graph technology and semantic database engines. Its semantic technology is distinctive for its performance, scalability, robustness and compliance with open standards. Ontotext solutions have been applied for business critical projects in the areas of financial services (S&P), publishing (BBC, Financial Times), life sciences (Astra Zeneca), industry and infrastructure management (Johnson Controls, Siemens, Stellantis/PSA), government organizations (UK Parliament, NASA) and others. Ontotext is the developer of GraphDB semantic graph database.

9. Pricing Summary

See <https://calculator.aws/#/createCalculator/EC2> for the current details on the r6id.8xlarge machine(s). Tables 18-22 describe pricing information for three years of usage. Using the same r6id.8xlarge Amazon machine, costing a fixed \$27,474.12 for all scenarios for three years (\$763.17 per month, standard saving plan, no upfront). The license cost is variable based on the number of cores used, not the number of cores available. Each core costs \$2500 per year. The maintenance cost is \$0 since this is already covered in the license cost. The number of cores required for a license is calculated as follows:

CPU_cores_license = number_of_read_threads + (number_of_machines * number_of_write_threads)

This is because the writing threads are not distributed through the cluster, but the reading threads are.
